Application: Software Engineering Intern – Fullstack

Dear Doctolib Engineering Team,

Publishing Bayaaz, my poetry app, meant building more than a mobile interface. I shipped it on Google Play and the App Store, and I maintain its FastAPI backend, PostgreSQL database and React frontend. It gave me a practical reason to work across the stack: each piece had to come together into something people could use.

At Logiciel, I worked on a different kind of interface: a Python AI chatbot that let business teams query financial data in plain language through a REST API. It reduced analyst turnaround by 41%. Alongside that, I built backend infrastructure and a Rust framework that cut daily processing from 500 to 50 minutes. These projects taught me to connect technical decisions to a concrete problem for the person using the system.

That is what draws me to Doctolib: building features that make daily work easier for care teams and patients. I am now pursuing an M.S. in Data Science at Milano-Bicocca and would like to bring my experience shipping software to your Milan team. I use AI-assisted coding tools, automated testing and peer review, and would welcome the chance to learn your stack alongside experienced engineers.

Thank you for considering my application.

Best regards,
Abbas Taqvi
